

ACCOUNTING FOR TRAVELING TIME WITHIN SCHEDULING SOFTWARE

ABSTRACT

A method for scheduling meetings within a scheduling application can include the step of identifying a meeting location and a meeting time for a meeting. An origination location can be determined for at least one meeting participant. Travel time for the participant can be automatically computed based at least in part upon the meeting location and the origination location. A time that is based at least in part upon the computed travel time can be presented within the scheduling application. For example, a suggested departure time can be computed and presented within the scheduling application, where the suggested departure time is based upon travel time and meeting time.
